Re: Application for Senior Salesforce DevOps Engineer

Dear Divya,

I am writing to express my interest in the **Senior Salesforce DevOps Engineer** role. With 30+ years across enterprise engineering, architecture, automation, release management, and complex delivery, including more than eight years in Salesforce technical leadership and CI/CD automation, I offer the practical DevOps capability required to support secure, scalable Salesforce delivery.

As Release Manager & Technical Lead at Origin Energy, I established a Salesforce DevSecOps capability that bridged development, testing, release, and operations. I moved delivery from fortnightly manual change sets to a hybrid automated CI/CD model capable of deployment cycles every 15 hours, supported by Git-based governance, peer reviews, repository approvals, regression testing, Snyk compliance checks, and repeatable deployment controls.

My background aligns strongly with this engagement:

- **CI/CD and source control:** Engineered Salesforce deployment workflows using Git branching strategies, pull requests, repository-based approvals, and controlled promotion across environments.
- **Environment and release governance:** Standardised deployment pathways, supported multi-tier Salesforce environments, embedded quality gates, and reduced release bottlenecks and operational incidents.
- **Salesforce technical depth:** Hands-on experience across Sales Cloud, Service Cloud, Apex, Flow, REST APIs, Platform Events, data validation, integration mapping, and refactoring complex declarative and programmatic logic.
- **Agile delivery leadership:** Worked closely with architecture, development, testing, vendor, and business teams across mobilisation, design, configuration, testing, release management, defect resolution, and production support.
- **Testing and continuous improvement:** ISTQB-certified test automation lead with experience designing regression and performance frameworks that improve reliability, traceability, and delivery confidence.
- **AutoRABIT, Gearset, Bitbucket, and Azure DevOps:** At Origin, the pipeline evolved from change sets to Gearset with Bitbucket, then through a mandated migration to Azure DevOps and AutoRABIT. I configured, supported, and troubleshooted Gearset and AutoRABIT, and later helped mature the capability through Salesforce DX and GitHub Actions.

I am well prepared to support the hybrid working arrangement and meet Baseline security requirements. I bring hands-on experience with Gearset, AutoRABIT, Bitbucket, Azure DevOps, Salesforce DX, GitHub Actions, and Git-based release governance, and I can adapt quickly to Copado or GitLab where required.

Thank you for your consideration, and I look forward to discussing how my Salesforce release engineering and delivery background can support your team.

Yours sincerely,

Efraim Taranto
