Re: Application for Senior Engineer - Salesforce (Customer 360 Tribe)

Dear Hiring Team,

I am applying for the Senior Engineer Salesforce position within REA Group's Customer 360 tribe. I bring more than 30 years of software engineering and architecture experience, including hands-on technical leadership across enterprise Salesforce platforms, event-driven integrations and delivery transformation. My combination of deep engineering capability and collaborative leadership would enable me to help REA deliver secure, scalable solutions and dependable customer data across the Customer Marketplace portfolio.

Throughout my career, I have built resilient Salesforce platforms and integrated them with complex enterprise ecosystems. Most recently, at Origin Energy, I combined hands-on engineering with technical leadership across Salesforce core architecture. I designed event-driven and asynchronous integrations using Platform Events, REST APIs and message queues; refactored complex Apex, triggers and flows to remove critical bottlenecks and helped reduce operational incidents by 90%. I also designed and delivered end to end solution supporting more than 50,000 points of delivery automated order generation, saving over 3000 operational setup hours each year and improving platform reliability. These outcomes reflect the capabilities REA is seeking across Salesforce engineering, integration, operational excellence and continuous improvement:

- **Salesforce engineering and architecture:** Deep hands-on expertise in Apex, Lightning Web Components, asynchronous processing, governor-limit management, and Salesforce security and sharing models, supported by experience designing and improving enterprise Sales Cloud and Service Cloud solutions.
- **Integration and event-driven systems:** Proven experience designing fault-tolerant REST and SOAP APIs and event-driven architectures that connect Salesforce with enterprise back-end and messaging platforms. This foundation equips me to contribute effectively to REA's AWS integration strategy and to deepen my hands-on capability with services such as Lambda, SQS and SNS.
- **DevSecOps and engineering excellence:** At Origin Energy, I established a DevSecOps pipeline using GitHub Actions, automated regression testing and Snyk security controls. This replaced a fortnightly manual release process with automated deployments that could be completed within 15 hours, improving release consistency, security and delivery responsiveness.
- **Technical leadership and mentoring:** Extensive experience guiding engineering squads, reviewing solution designs and code, championing test-driven development, and helping teams adopt consistent engineering practices. My ISTQB certification complements this practical focus on automated quality, accountability and continuous improvement.

My interest in REA is also grounded in a longstanding connection with its engineering culture. In 2018, I organised a visit by Origin Energy's Salesforce squad to REA, where Nigel Dalton spoke about the importance of critical thinking. That message, together with REA's clearly expressed cultural principles, influenced how I helped shape our team culture and continues to inform the way I approach people, decisions and complex technical work.

REA Group's purpose-driven culture, focus on engineering excellence and commitment to collaborative problem-solving strongly appeal to me. Based in Melbourne, I would welcome the opportunity to contribute hands-on Salesforce leadership to the Richmond team, strengthen the platform and integrations that underpin Customer 360, and help squads deliver reliable customer experiences and accessible foundational data.

Thank you for considering my application. I would welcome the opportunity to discuss how my Salesforce engineering, integration and technical leadership experience can support REA Group's Customer 360 strategy, product roadmap and culture of engineering excellence.

Yours sincerely,
Efraim Taranto
